Direct Submission

Submitted (02-AuG-1999) Drosophila Genome Center, Lawrence Berkeley, Laboratory, MS 64-121, Berkeley, CA 94720, USA

Con Feb 11, 2000 this sequence version replaced gi:5670417.

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgpffruitfly.berkeley.edu. All condigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a 'working draft' sequence. It currently consists of 92 contings. The true order of the pieces

* is not known and their order in this sequence record is
                                                                          AC008323 123296 bp DNA HTG 10-FEB-2000

CA MARCA (1900) This sequence, Including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a 'working draft' sequence. It currently

* consists of 83 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

                                                                                                                                                                                                                                                                                                                             misc_feature
                                                                                                                                                                                                                                                             Trequests: Choracequeses desanger.ac.uk

On Dec 13, 1999 this sequence version replaced gi:1903194.

During sequence assembly data is compared from overlapping clones.

Muste differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with a sequence has been finished above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Em:, EMBL; Sw:, SWHSSPROT; Tr., TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22 Mapping Group. Further information can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Roswell

It currently consists of 74 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      unknown length
of 1169 bp in length

The reaper (rpr) and head involution defective (hid) genes, mapping to position 75c1,2 of D. melanogaster chromosome 3, exhibit expression patterns related to the pattern of cell death during brosophila embryogenesis. Cell death genes, or antisense sequences, can be used to reduce or abolish apoptosis, e.g. in transgenic animals. An hid cDNA sequence is given in 066950, and the deduced sequence of the encoded HID protein in R55791.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The reaper (rpr) and head involution defective (hid) genes, mapping to position 75cl.2 of D. melanogaster chromosome 3, exhibit expression patterns related to the pattern of cell death during Drosophila embryogenesis. Cell death genes, or antisense sequences, can be used to reduce or abolish apoptosis, e.g. in transgenic animals. The genomic sequence of hid is given as 4 contiguous sequences in 066946-49, which together encode HID protein. Sequence 502 Bp; 141 A; 135 C; 135 G; 90 T;

                                                                                                                                                    which is part of a non-naturally occurring chromosome. Nucleic acids comprising the CYPBA4 polymorphic sequences can be used to screen patients for altered metabolism for CYPBA4 substrates, potential drug-drug interactions, and adverse/side effects as well as diseases that result from environmental or occupational exposure to toxins. They can also be used to establism. Polymorphic cyPBA4 gene sequences can be used for expression studies to determine the effect of promoter and/or intron sequence variations on maRNA expression and stability. The polymorphisms are also used as single nucleotide polymorphisms to detect genetic linkage to phenotypic variation in activity and expression of CYPBA4. The nucleic acids can also be used to generate genetically modified non-human similars or site specific gene modifications in cell lines.

                                                            Disclosure, Page 30; 40pp; English.
This sequence represents an intron of the human CYP3A4 ge.
The invention relates to a CYP3A4 sequence polymorphism,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  indels

This sequence represents a polynucleotide of the invention. It was isolated from Helicobacter pylori and encodes a H.pylori GHPO protein. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroducdenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases. G.g. gastric and duodenal ulcers. They can also be used for the production and diagnosis.

When the probability of alpha-1,4-glucan lyase from fungus - and its recombinant prodn from isolated DNA.

For Isolation of alpha-1,4-glucan lyase from fungus - and its recombinant prodn from isolated DNA.

Claim 9; Pages 30-32; 51pp; English.

CC The enzyme alpha-1,4-glucan lyase(GL)was purified from Morchella costata (Mc) by affinity chromoatography on beta-cyclodextrin costata (Mc) by affinity chromoatography on beta-cyclodextrin costata (Mc) by affinity chromoatography on beta-cyclodextrin aspharose (RTM), ion exchange on Mono O HR 5/5 (RTM) and gel costatation on Sepharose (RTM) 12 columns. The purified enzyme an Isolectric point of pl 5.4. The optimum pH range for the fungal cost lyase catalysed reaction was between pH 5 and pH 7. The purified cost lyase catalysed reaction was between pH 5 and pH 7. The purified cost lyase catalysed reaction was between pH 5 and pH 7. The purified cost lyase catalysed reaction was between pH 5 and pH 7. The purified cost matter cost and tose (28). The lyase was digestesd with codoproteinase Arg-C from Clostridium histolyticum or endoproteinase CC waltering (see FT). Amino acid sequences of three overlapping cC tryptic peptides from GL (se R72713) were used to generate mixed collops which could be used as PCR primers for the amplification of Sequence (20 DNA isolated from Morchella. The primers are 089703-4 and 090305-6.

                                                                                                                                                                                                                                                                                       with pure alpha-1,4-glucan lyase, martic. useful as antioxidant and sweetener for foods and beverages
Claim 12; Page 101c-102b; 166pp; English.
An alpha-1,4-glucan lyase enzyme (preferably pullanase or isoamylase)
Is used in a new method for the production of 1,5-D-anhydrofructose.
The enzyme is isolated from either a fungus (M.costata or M.vulgaris)
or from fungally infected algae (G.lemaneiformis) or algae alone.
1,5-D-anhydrofructose is useful as an antioxidant and sweetener for foodstuffs and beverages. It is also useful as an intermediate for the antibiotic microthecin, an oxygen scavenger during polymerisation reactions and as a reducing agent in the synthesis of blodegradable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          243 ccgggcgtaaaccggtaacgcatcacctgacggaagaaatgcaaaaagagtttcattaca 302

                                                                                                                                                                                                                                                                                                Morchella costata used in claimed processes of the invention. A morchella costata used in claimed processes of the invention. A claimed process of preparing a medium that contains an antioxidant and at least one other component involves preparing antioxidant from a glucan, in situ, by use of recombinant DNA techniques. Also claimed are: (1) use of anhydrofructose is prepared in situ in the medium; (2) use of anhydrofructose is prepared in situ in the medium; (3) use of glycan lyase for imparting or improving in situ in the plant; (3) use of glycan lyase for imparting or interest tolerance in a plant, or (ii) transformation of insitu in the plant; (3) use of glycan lyase as means of incleotide sequence (NS) coding for a glucan lyase as means of imparting or improving stress tolerance in a plant, where the NS is expressed in situ in the plant; and (5) use of a NS coding for a glucan lyase as means of imparting or improving stress tolerance in a plant, where the NS is expressed in situ in the glant, and (5) use of a NS coding for a glucan lyase for imparting or improving the transformation of a grape, where the NS is expressed in situ in the grape. The preparation of foodstuffs such as beverages, in particularly alcoholic beverages such as wine (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            968 GTATCCGCACTGATACCGTAACAATCGATACCACCATACCTGGTTCCCAGCTTGATGTAG 909°

Claim 1; Page 14-15; 30pp; French.
A 1.3% cDNA fragment (057701) was isolated from a library of K.lactis 2359/152 genome fragments fused to E.coli lacz. The isolated clone comprises a strong promoter sequence suitable for high level expression of recombinant proteins in Kluyveromyces or other yeast hosts. The promoter is not subject to glucose repression so can be used in conventional culture media. See also 057702. Sequence 1349 BP; 397 A; 271 C; 202 G; 479 T;

Fishbox, W. Labbar.

Fishbox, W. Labbar.

1-beta - useful for detecting susceptibility for non-insulin dependent diabetes. especially maturity-onset diabetes of the young claim 95; Fig 26A-M; 363pp; English.

This is a partial nucleotide sequence of the gene (TCF2) encoding human hepatocyte nuclear factor 1 beta (HWF1) beta, see W1580), a homeodomain-containing transcription factor. Mutations in this gene are indicative of a propensity to diabetes mellitus. The invention concerns the identification of genes responsible for diagnostics and therapeutics. It demonstrates that the MODY3 locus

It is used for treating tumours, particularly oestrogen-sensitive epithelial tumours. The protein can also be used to produce antibodies which in turn can be used in diagnostic applications.

Sequence 618 BP; 107 A; 232 C; 189 G; 90 T;
is the HNF-1 alpha gene (see V52625), the MODY4 locus is the HNF-4 alpha beta gene (see also V52730) and the MODY1 locus is the HNF-4 alpha dispen (see V52687). Analysis of mutations in these HNF genes can be diagnostic for diabetes. The invention also contemplates methods of screening for modulators of HNF function utilising HNF nucleic acids or polypeptides, the modulators being useful for treating diabetes by modulating HNF function in an animal.

Wethod for the detection of bacterial species using probes and wethod for the detection and quantification of antibiotic.

PT resistant bacteria in patients, the environment and food
Claim 34: Page 70-71: 216pp; English.

CC The sequences given in T28490-503 represent probes which were used in the method of the invention for the detection of P. aeruginosa in a sample. The method comprises using probes and/or amplification primars which are specific, ubiquitous and sensitive for determining the presence of and/or amount of nucleic acids from selected bacterial species in any sample, where the bacterial uncleic acid comprises a selected target region hybridisable with the probes or primers and detecting the presence and/or amount of hybridised primers or amplification products or presence and/or amount of hybridised primers or amplification products as and indication of the presence and/or amount of the bacterial pathodens, e.g. Escherichia coli, Klebsiella pneumoniae, Species. This method may be used to detect commonly encountered bacterial pathodens, Proteus mirabilis, Streptococcus prognemoniae, Staphylococcus saprophyticus, Streptococcus prognemes, Haemophilus influenzae and Moraxella catarhalis. These bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                           Sequence 93, Application US/08056200
Patent No. 5616500
GENERAL INFORMATION:
APPLICANT: Steinert, Peter M.
APPLICANT: Kim, In-6yu
APPLICANT: Chung, Soo-11
APPLICANT: Park, Sang-Chul
TITLE OF INVENTION: Trichohyalin and Transglutaminase-3 and
TITLE OF INVENTION: Mehods of Using Same
NUMBER OF SEQUENCES: 117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 81; Indels
